1. Qwenta Web Site Description

Webgencia, as the quality web site development agency, will develop a menu web site for Qwenta.

This web site is allows restaurateurs to create, modify and manage their menus for online distribution and printing. For now requirement for website is to be dynamic and responsive.

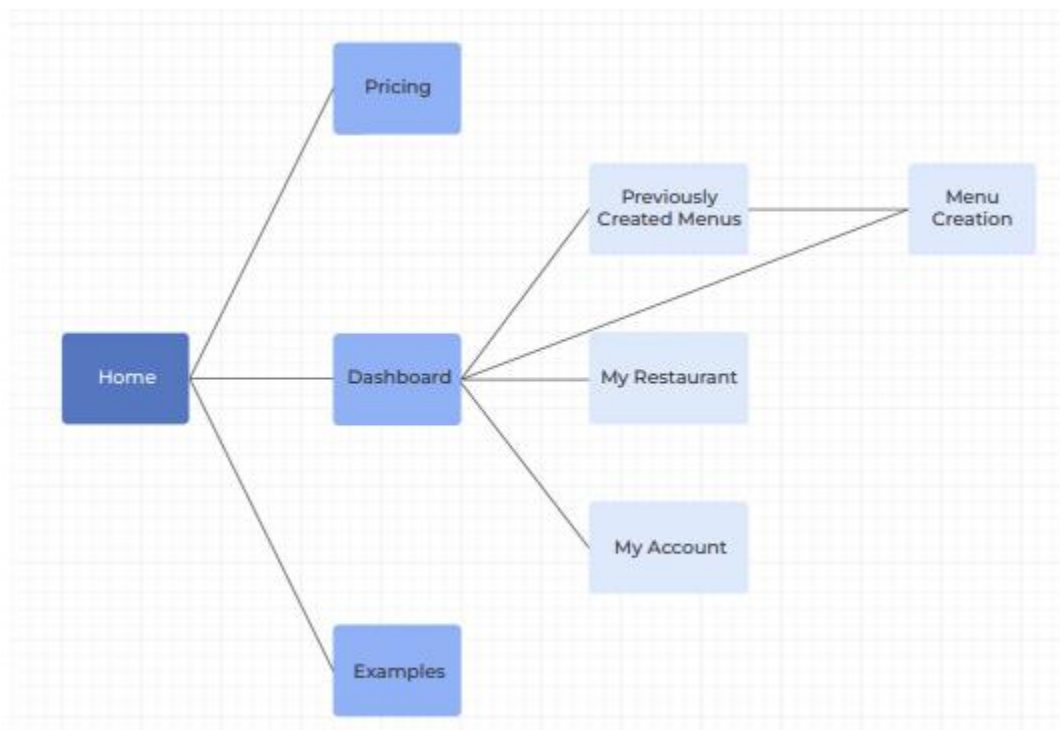

Qwenta approach to the solution is giving already completed Figma design and professional template for technical specification

Website by Qwenta is menu maker site that presents user with options to view menus and create one of you own.

There are 4 main requirements:

- Create a menu
- Customize a menu
- Distribute a menu
- Print a menu

Proposed web site structure is as follows:

Below are details in design proposed by Figma desingn by Qwenta to implement these requirements.

Landing page of the website gives general information of Qwenta and steps on how to create your own menu. It shows images of ready menus in different restaurant settings. It also gives navigation for examples and prices by Qwenta.

With Menu Maker, you can create a unique identity for your business. Create your menu online and share it on all platforms!

Customize Your Menu

Add your dishes and drinks, and then arrange your menu to suit your needs. Whether you're printing it or sharing it online, you can download your menu in the format you want and distribute it to your customers!

How to Create Your Menu

You can create your menu in just three easy steps.

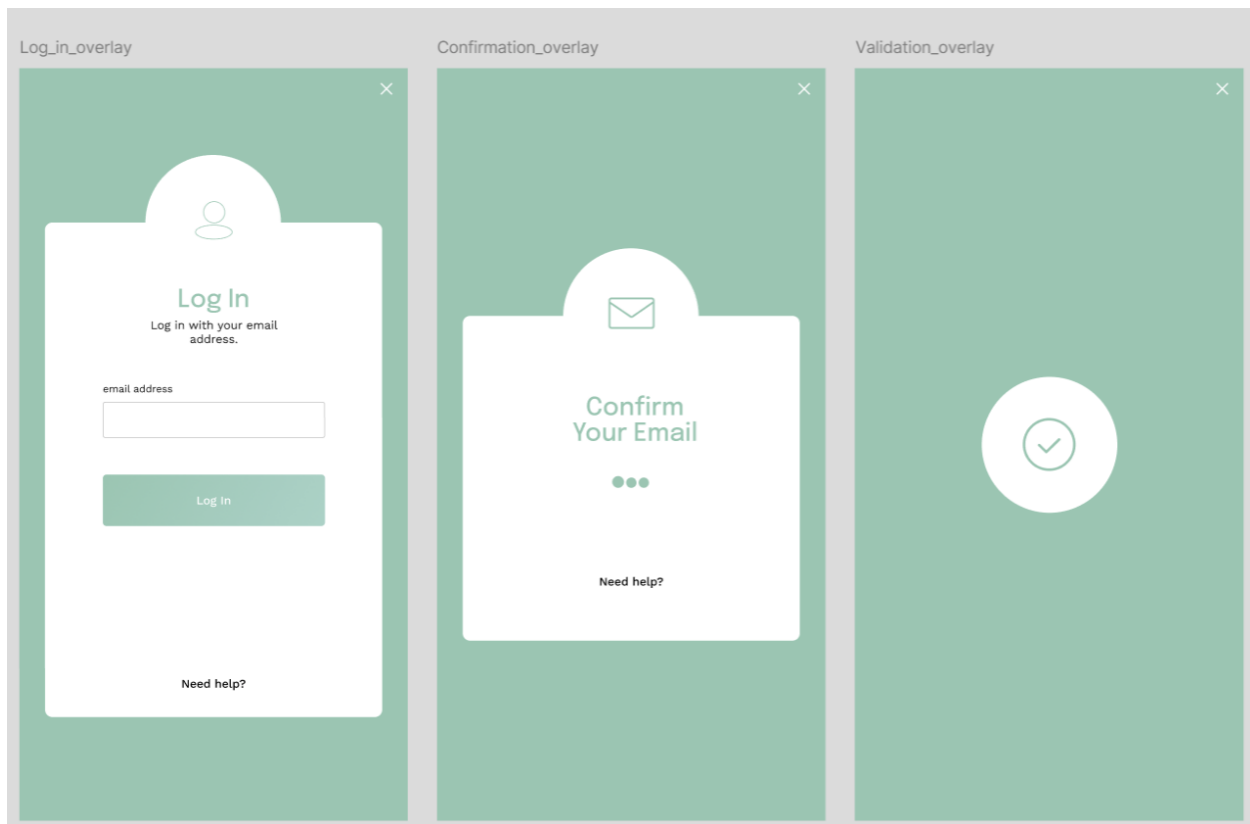

- 1

List all of the drinks, appetizers, main courses, desserts, side dishes, etc. to display on your menu.
- 2

Choose the style that best reflects your restaurant (logo, colors, and fonts).
- 3

Save your menu in .pdf format and distribute it across your online platforms.

For user to get to the option of creation of a menu he needs to login to menu creation page. With three-parts password-less email authentication, modal pop-up will allow user to login menu creation screen.

Dashboard for menu creation page user is given options of creation, distribution and printing the menu with some advanced options to help it facilitate.

your menu on Instagram

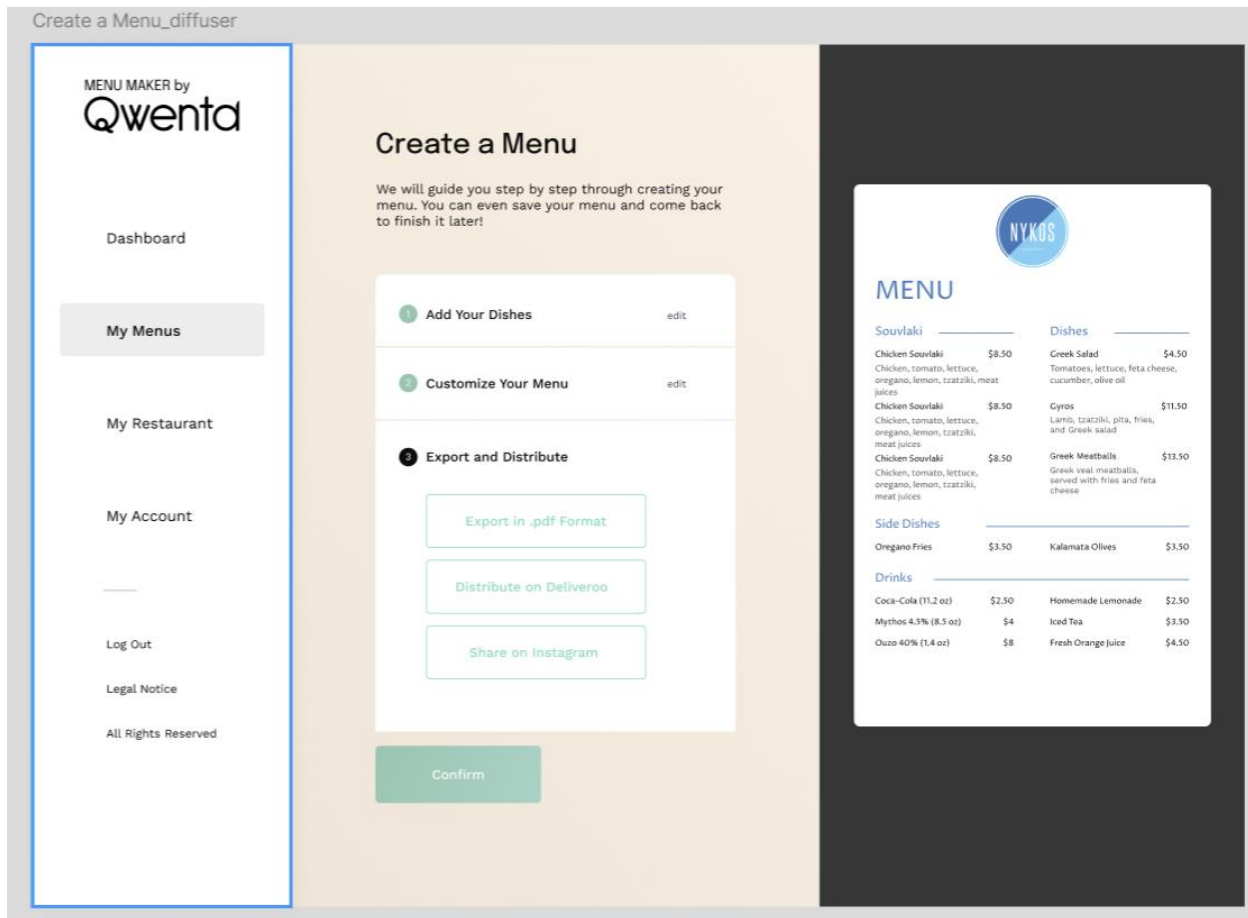

Menu creation is the main part of the website. It allows to add categories and dishes to the menu with corresponding images. It also allows to style the menu. Restaurateur will first choose menu category, then add dishes to newly created menu.

After the menu is ready, user will be ready to modify menu style by changing font and size of letters.

There will be an option to print menu through Qwenta backoffice, save it in PDF and distribute it.

To achieve required functionality, in addition to front-end, there should also be a backend that would allow:

- Save menu
- Update menu
- Change style
- Access previously created menu and modify it
- Save menu in a PDF format
- Print menu
- Update user with additional emails and payment information
- Future development will include ability for restaurateur to post blogs on the website

Website also has to be hosted with Qwenta domain qwenta.com.

2. Technologies in Qwenta development

For Qwenta development 3 main parts will be used:

1. React framework as frontend with Typescript as a Programming language
2. NodeJs framework for backend that will also be using typescript
3. MongoDB as a NoSql database.

Following libraries will be used to accomplish task required for web site to work properly:

- react-modal for modals used in Qwenta
- react-to-pdf to create PDF menus
- resend for sending secure email from backend
- crypto to generate secure token for user authentication

3. Monitoring System

To monitor what technologies to use, Webgencia will be using technologies Monitoring System. This will allow team to choose right techniques, use top techniques used in industry for Web site development and get proper tools for tasks used in Qwenta development.

For Monitoring System we used feedly.com that gave use necessary board for technologies feed. Link to Monitoring system: <https://feedly.com/i/board/content/user/c36ee191-1e79-4de5-9486-b76b4cbf23c2/tag/5ea99528-bd76-42db-bb69-be5da86ccf76>

4. Planning Development with Kanban

For planning Qwenta site and distributing work in the team in Webgencia we are using Jira Kanban board. Link to our the board:

<https://igorvish.atlassian.net/jira/software/projects/QKB/boards/1?filter=&groupBy=none&selectedIssue=QKB-19>

Each task (story) has developer assigned, has priorities, description of what needs to be done, definition of what criteria for story to complete, model used and sub-tasks specifying technical details.

Dish Creation

Description

Restaurateurs need the ability to add a dish/dishes to their menu.

Success

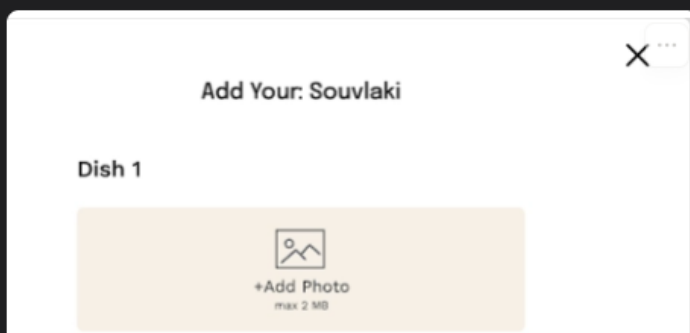

Restaurateurs must be able to:

- ☐ Select a category.
- ☐ Edit the selected category.
- ☐ Enter information about their dish.
- ☐ Add dishes to the category using a modal window.
- ☐ Each dish can have:
 - ☐ A photo.
 - ☐ A name.
 - ☐ A price.
 - ☐ A description.
- ☐ Create as many dishes as they'd like.

Scope

Design

- It should be possible to scroll through the modal window to see all the information displayed.

Model

```
Dish {  
  
  name: String  
  
  imageUrl: String  
  
  price: floating point number  
  
  description: String  
  
}
```

Confluence content

Finally we are proposing following model for communicating

- weekly meeting with Qwenta stakeholders showing progress to be made and retrieving feedback
- we propose meetings to be in-person so the feedbacks, visual presentations and feedback to be most effective. We also provide zoom for online participants.
