

Monitoring tool to keep for Qwenta Menu Maker

For monitoring tool I used feedly.com

Below is my monitoring tool link and screenshot. It has article related to Reactjs, JavaScript, converting HTML to PDF in react that is used in Qwenta board and creating verification email in react. Link to my feedly borad is :

<https://feedly.com/i/board/content/user/c36ee191-1e79-4de5-9486-b76b4cbf23c2/tag/5ea99528-bd76-42db-bb69-be5da86ccf76>

To get general articles that are related to react and javascript I created 2 feeds, one for React and one Javascript:

Designing the Email Verification User Interface in React

Before we dive into the implementation details, let's design the user interface (UI) for the email verification process. In this example, we'll assume a simple UI with an email input field and a "Verify" button.

Here's a basic example of the email verification component in React:

```
import React, { useState } from 'react';

const EmailVerification = () => {
  const [email, setEmail] = useState('');

  const handleEmailChange = (event) => {
    setEmail(event.target.value);
  };

  const handleVerifyClick = () => {
    // TODO: Implement email verification logic
  };

  return (
    <div>
      <input
        type="email"
        value={email}
        onChange={handleEmailChange}
        placeholder="Enter your email"
      />
      <button onClick={handleVerifyClick}>Verify</button>
    </div>
  );
};

export default EmailVerification;
```
