

Technical Specifications

Project	Qwenta Menu Maker
----------------	-------------------

Version	Author	Date	Approval
1.0	[author's name]	[document creation date]	[name of the person who will review and approve the document]

The purpose of this document is to define and justify the technical specifications for [project name].

I. Technology Decisions

- Overview of the functional requirements and their technical solutions:

Requirement	Constraints	Solution	Description of the Solution	Supporting Arguments (2)
<i>e.g.: Menu category creation</i>	<i>e.g.: It should be possible to add a category directly from a modal window on the menu creation screen.</i>	<i>e.g.: react-modal</i>	<i>e.g.: This React library simplifies the creation of powerful, accessible modal windows with minimal coding.</i>	<i>e.g.: 1) We've decided to develop in React. The library is consistent with this choice. 2) This is the most commonly</i>

				<i>used library.</i>
<i>Landing Page (not logged in)</i>		<i>React, Sass for CSS</i>	<i>React is best for components for front end application</i>	<i>React and Sass are in the front of web development currently.</i>
<i>Landing Page (not Logged In) Feature improvements</i>		<i>Css Animation for Banner image, CSS animations to geometric shapes of sections</i>	<i>This is simple solution instead of using third party library</i>	<i>Best for simple animations</i>
<i>Login Modal</i>		<i>React-modal</i>	<i>Simplifies creation of modal window</i>	<i>Since application is written in react, it is consistent with solution</i>
<i>Sending authentication email from modal</i>		<i>1. user enters email and click login button 2. modal changes to view state with verification screen that fires asynchronous</i>		<i>This is secure way to make sure user's email is not tempered.</i>

Webgencia

		<i>HTTP POST request to authenticate backend 3. backend saves email, generates auth id, put sstatus to pending 4. after user authenticate email on her phone, state changing to verified. While user is waiting css animation with dots displays 4. If success, third modal is opened and shows checkmark sign</i>		
<i>Creation bear token when</i>		<i>Create and save bearer</i>	<i>Generate bearer token that is saved in browser until it</i>	<i>Standard process needed for security instead of using</i>

<i>user logged in</i>		<i>toekn</i>	<i>expired or the user clicks logout</i>	<i>cookies.</i>
<i>Dish category</i>		<i>react-modal</i>	<i>Simplifies creation of modal window</i>	<i>1) We've decided to develop in React. The library is consistent with this choice. 2) This is the most commonly used.</i>
<i>Dish category save, update</i>		<i>Rest call to backend</i>	<i>CRUD call for dish category.</i>	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>Dish creation</i>		<i>Rest call to backend</i>	<i>CRUD call for dish.</i>	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>Menu style</i>		<i>React hooks useState</i>	<i>Use react hooks to add CSS classes that will change font size and color</i>	<i>Use react hooks instead of external library is easiest.</i>
<i>PDF export</i>	It still technically mounts to the real DOM for a split second behind the scenes so the canvas engine can see it, but React manages the entire lifecycle	<i>react-to-pdf library. Rest call to save pdf in the backend</i>	<i>External library to convert menu that is in-memory react html to pdf.</i>	<i>Library dedicated to react.</i>
<i>Order a printed menu</i>		<i>deep linking if application is</i>	<i>Call to open Deliveroo website or application.</i>	<i>Easiest way to handle external website/application.</i>

		<i>desktop or window.open() if it is a external website</i>		
<i>Previous Menu</i>		<i>Rest call</i>	Rest call to get menu, update menu, create new menu Menu should also have a date	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>Legal Notice</i>		<i>react-modal</i>	Modal for Legal Notice and All Right Reserved	<i>Library to ease use of modal in react since we are using react for Qwenta.</i>
<i>Prices</i>		<i>window.open page in new tab</i>	New tab will have predefined prices page	<i>Easiest solution to display static page.</i>
<i>Share on instagram</i>		<i>Rest call</i>	Rest call to upload image and captions to Instagram account	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>User information</i>		<i>Rest call</i>	Rest call to update user information Rest call to link multiple emails to user	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>Dashboard</i>		<i>Clickable cards</i>	Standard javascript/react technique.	<i>Easiest solution.</i>

<i>Menu maker blog</i>		<i>Rest call to save block and get it</i>	CRUD call to save blog	<i>Standard for saving, updating and deleting data in the front end.</i>
<i>Restaurant branding</i>		<i>Rest call</i>	Create logo: Rest call to create /update/ delete Logo	<i>Standard for saving, updating and deleting data in the front end.</i>

II. Links With the Backend

—

- Which server language? *e.g.: Node.js/PHP/Python, etc.*
- Is an API needed? If yes, which one?
- Selected database: *e.g.: SQL/NoSQL*

III. Domain and Hosting Provider Recommendations

—

- Domain name
- Hosting provider name
- Email address

IV. Accessibility

—

- Browser compatibility
- Device types

V. Third-Party Services

—

- Names and supporting arguments for third-party services that will need to be implemented for effective website operation and monitoring (e.g., plugins)

VI. Security Recommendations

—

- Access to accounts, plugins, etc.

VII. Website Maintenance and Future Updates

- Major points of the maintenance contract
